I have written about this several times already that **ZIKUU is a backup device for civilization**.

When people think of civilization, they often imagine states and social systems. In reality, the things that truly support it are far more basic: living spaces, workspaces, production equipment and tools, people, and AI. These elements operate together as an integrated environmentâ??that is the fundamental structure of ZIKUU.

When viewed as a system, this structure can be organized into layers:

- **Physical Layer** â?? living spaces, workspaces, equipment, and tools.
- **Memory Layer** â?? knowledge in the form of papers, documents, books, textbooks, databases, etc.
- **Thinking Layer** â?? humans and AI.
- **Judgment Layer** â?? the final decision is made by humans; it is not delegated to AI.

default watermark

From a systems perspective, **Nerve** stores information in the memory layer. In the thinking layer, a monitoring device called **Pivot Service** is installed, and there sits the **AI Instructor**.

With this view, it becomes clear that ZIKUU is **not just a facility but a structure.**
It is not a workshop, a softwareâ??development company, a cram school, or an AI research institute.
It is a structure that encompasses all of those and serves as a **â??civilization backup device.â?•**

And this structure has one defining feature: **it can exist whether it is large or small.**
Because it is a vessel whose purpose is not specified, any ethnicity, any nation, and any individual can use it.
This was the design we considered when launching ZIKUU, and its form is gradually taking shape.

The fact that the structure can be large or small and can expand horizontally naturally leads to the next form: an alliance of small civilization units.
In other words, a **village**.

That village functions simultaneously as a research facility, a production facility, a cultural facility, a training facility, and a place of living.
Its scale is about 50 people, of whom 20 are children.
The work of the adults takes place within the village itself. That is the nature of the village.

The illustration at the beginning is a conceptual image of that village.
A single road stretches through a mountainous area, and a signboard reads â??ZIKUUâ?¯Villageâ?• at the entrance.
Inside, the view opens up to houses and work buildings, with rice paddies and fields spreading out around them.
Here, adults work cooperatively while children watch and learn.

A small hydroâ??electric facility along the river beside the village supplies power for the entire community.
The central square is a park with a fire pit in its middle. Children run around, and in the evening everyone watches the sunset together.
At night, a small observatory next to the village observes the stars.
People gather around the fire, eating, drinking, and enjoying conversation.
Various ideas are exchanged there, and people from different disciplines collaborate on creating things.

In a corner of the village is a small data center housing a condensed version of the ZIKUU system called **ZIKUUâ?¯Mini**
It ingests external information, organizes internal information, and the AI assists with thinking.
It is not isolated from the world; what the villagers can do themselves, they do themselves. It is an autonomous village.

This is the smallest unit of civilization.
When these villages connect through a network, they form clustersâ??an infrastructure for a decentralized civilization.
ZIKUU is the seed that generates these smallest units.

default watermark

ZIKUU does architecture. It tends fields and rice paddies. It develops software. It builds telescopes and tools.
That is why it can actually assemble something like a **ZIKUUâ?¯Mini Village**
